Chapter 1

INTRODUCTION

1.1 PURPOSE

The objective of this thesis was to develop a model that simulates the interactions between a number of close air support aircraft and helicopters on a flight deck during an amphibious assault. Application of this model permits a quantitative investigation into the operations of various mixes of current aircraft on a specific flight deck, and with minor modification, the effects of future aircraft and future flight decks can be examined.

The model is currently configured for operations aboard an LHA flight deck with two types of transport helicopters and the AV-8 Harrier attack aircraft. The model application presented here considers the maximum number of AV-8 Harriers that could operate effectively with a composite helicopter squadron during the amphibious assault of a Marine Amphibious Unit.

1.2 BACKGROUND

The principal mission for the United States Marine Corps is the amphibious assault. An amphibious assault is characterized by the ship-to-shore movement of troops and equipment by surface craft and aircraft to establish a beachhead and attain an operational objective. The success or failure of the assault may be determined by the initial rate of force buildup, when the landing force must rapidly be concentrated to overwelm opposition to the landing.

Marine amphibious task forces come in a variety of sizes, ranging from a Marine Amphibious Unit (MAU) of approximately 2500 personnel to a

Marine Amphibious Force (MAF) of nearly 50,000 personnel. During peacetime, Amphibious task forces are normally deployed as MAUs embarked on 3-7 Naval amphibious ships. Usually, one of these ships will be a general purpose amphibious assault ship of the Tarawa LHA-class.

An LHA has a flight deck configured for helicopter operations, a floodable well deck for landing craft operations, a hangar deck for storing and maintaining aircraft, a 300-bed hospital, living spaces for a crew of 900 and 1900 Marines, and cargo spaces for the weapons, equipment, and supplies to support these Marines for several weeks. In addition to the composite helicopter squadron that the LHA usually operates with, a detachment of AV-8 Harriers may also be carried. AV-8s have a vertical/short takeoff and landing (V/STOL) capability, and are embarked to assist in the beach preparation prior to the assault and to provide close air support during the assault.

The AV-8s are a valuable asset to the MAU, but LHAs were not designed to support fixed wing aircraft, and helicopter operations must be temporarily suspended when AV-8s launch or recover. The competition between AV-8s and helicopters for limited flight deck assets necessarily slows the offload of troops and equipment, the delay increasing with the number of AV-8s. As mentioned earlier, speed is of the essence in the buildup ashore, but the capability afforded by the AV-8 presence can offset some reduction in the buildup rate.

In July 1982, a test was conducted in the Indian Ocean with a composite squadron of helicopters and 6 AV-8s. Among the conclusions was the finding that a composite helicopter squadron and 6 AV-8s are capable of integrated flight deck operations. Further tests have been postponed pending the introduction of a new version of the AV-8.

1.3 APPROACH

The goal of this model is to simulate the flight deck operations during an actual assault rather than an assault exercise. This approach was chosen because interest would obviously be the greatest in results obtained in a more realistic setting. For simulation purposes, the transition from an exercise to an actual assault requires the removal of the effect of training being conducted concurrently, and relaxation of the many safety requirements of peacetime operations. Exercise data must therfore be massaged with the guidance of experts from this operational area.

<u>alloword to a contract of the contract of the</u>

Two aspects of reality have not been included in the model: they are combat attrition and aircraft reliability. The intended effect of their absence is to stress the aircraft interactions throughout the simulated assault by not allowing the finite source population to decrease.

The model is a stochastic, discrete event system. The events of interest include all types of service or activity where helicopters and AV-8s might interact, both on and off the flight deck, during an assault landing.

The model verification and validation were both accomplished by stepping event by event through simulation output for many cases. A sample of this output appears in appendix B. Both efforts concluded that the model performs basically as desired.

Chapter 2

SYSTEM DESCRIPTION

The system consists of a number of aircraft (CH-46s, CH-53s, and AV-8s) that move between three major locations with a variable amount of activity and movement occurring at one of these locations.

The first major location is the Landing Zone (LZ). The LZ is the destination of the heliborne force during the assault landing. The helicopters arrive at the LZ in waves, and depart as soon as their load of troops and/or cargo has been unloaded. Their destination from the LZ is the delta pattern.

The delta pattern is a holding pattern established in the vicinity of the ship. Normally the delta pattern is a racetrack pattern around the ship, oriented on the ship's heading. Aircraft arrive to the delta pattern individually and join any other aircraft waiting there until the ship is able to recover them. The order of recovery depends on many factors, including fuel status, flying time remaining, time of next launch, and aircraft type.

The last major location is the ship; this is where the majority of the aircraft interactions occur. Relevant features of the ship include locations where aircraft may be positioned, and service activities that are not necessarily location dependent. Figure 1 displays the features of the flight deck on an LHA. The sytem description continues with the ship designated as of the LHA class. Locations aboard the ship are described as follows:

1. Deck Spots - There are six deck spots normally used for the launch and recovery of aircraft. These spots are located on the port side of the ship running from bow to stern. In figure 1, these spots are numbered 2,4,5,6,7,8. Spot 1 is not capable of recovering any of the aircraft listed above because of the limited amount of deck forward of the spot. Spots 3 and 9 could be

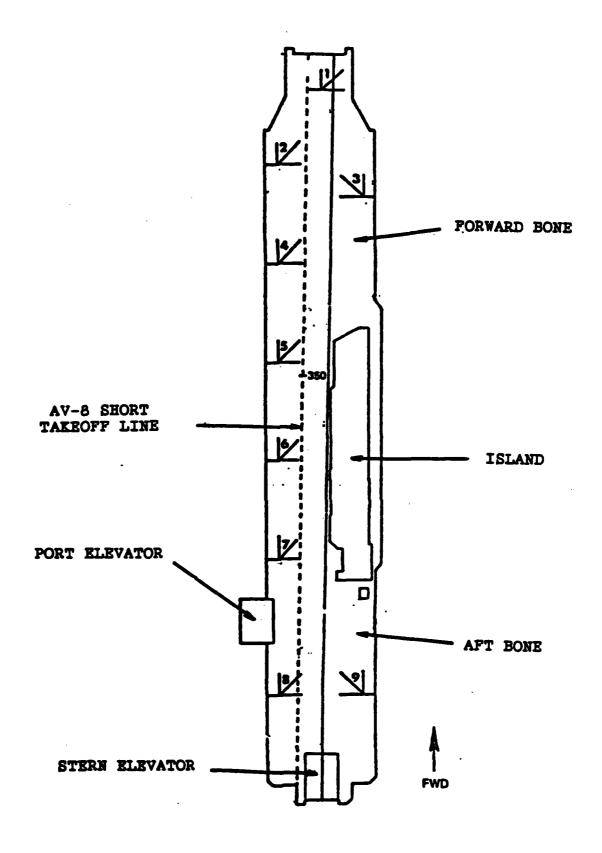

FIGURE 1. LHA FLIGHT DECK

MANAGEMENT COMMENSATION COMMENSATION CONTRACTOR OF STREET AND STRE

used for launch and recovery, but they have other uses, and are called the forward and aft bones, respectively.

- 2. Forward Bone The forward bone is the area forward of the island on the ship's starboard side. It is normally used as a parking area for aircraft waiting to respot to a deck spot for launching, and minor maintenance and refueling can be performed there. In the 1982 test, the forward bone was designated for use by the CH-46s.
- 3. Aft bone The aft bone is the area aft of the island on the ship's starboard side. It has the same uses as the forward bone, and in the 1982 test, it was designated for use by CH-53s and AV-8s.
- 4. Elevator There are two elevators on an LHA: one between spots 7 and 8 on the port side and the other centerline on the stern. The elevators connect the flight deck with the hangar deck and are capable of moving only one of the listed aircraft at a time. Normally, only one of the two elevators will be in use during an operation.
- 5. Hangar The hangar is located directly below the flight deck. It is used to store aircraft and perform all levels of maintenance.

The service activities that the aircraft on the ship are affected by include:

- 1. Refueling There are six refueling stations on the flight deck, each with two hoses. The stations are distributed on the deck so that an aircraft located anywhere on the deck is within the reach of at least one station's hoses. The stations are manned by four refueling crews that move between stations as necessary. The maximum number of aircraft that can refuel simultaneously is, therefore, four.
- 2. Loading Helicopters are loaded on any of the six deck spots immediately prior to launching. Each spot has a combat cargo representative to oversee the loading process, so all six spots may load simultaneously. AV-8s are loaded with ordnance in the aft bone. Two ordnance teams are normally embarked, so only two AV-8s may be loaded at the same time. Ordnance can be assembled in advance and staged to the loading area, so it is assumed that ordnance is always available when requested.
- 3. Respotting Respotting occurs for all aircraft to and from the deck spots, the bones, the elevator, and the hangar. Helicopters always require the assistance of a tug (tractor) when respotting. AV-8s may respot to the takeoff line from the bone, and from their recovery spot to the bone under their own power. In all other cases, AV-8s also require a tug for respotting. There are four tugs located on the flight deck and one located on the hangar

deck.

- 4. Launching Helicopters launch from the six deck spots previously mentioned. AV-8s launch with with a deck run along the short takeoff line. The length of the deck run depends on the aircraft weight, the wind speed, and the temperature, but at the very least, spots 1,2, and 4 must be cleared of aircraft prior to an AV-8 launch. Aircraft launch one at a time with a small interval between launches of aircraft in a wave.
- 5. Recovery All aircraft use the six deck spots previously mentioned for recovery. Generally, the smaller aircraft (CH-46s) are recovered on the forward spots and the larger aircraft (CH-53s) are recovered on the aft spots. During an emergency, all aircraft may be recovered on any of the port spots. Aircraft recover one at a time with a small interval between recoveries. Recoveries normally follow the launching of a wave.
- 6. Elevator service Described above
 Distributions for these service activities are presented in the discussion of
 Chapter 4.

The normal flow of helicopters and AV-8s through the system is shown in figures 2 and 3.

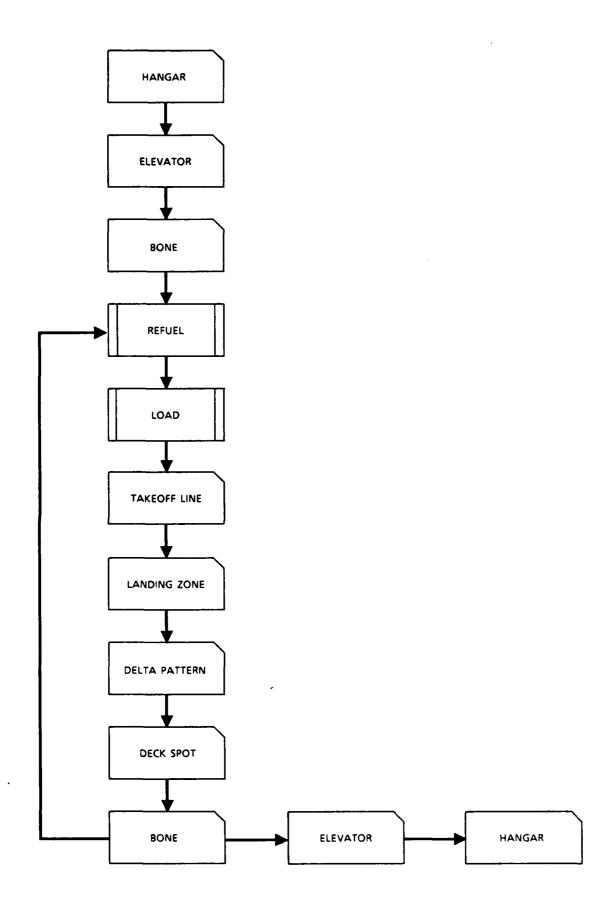

FIGURE 2. AV-8 FLOW THROUGH SYSTEM

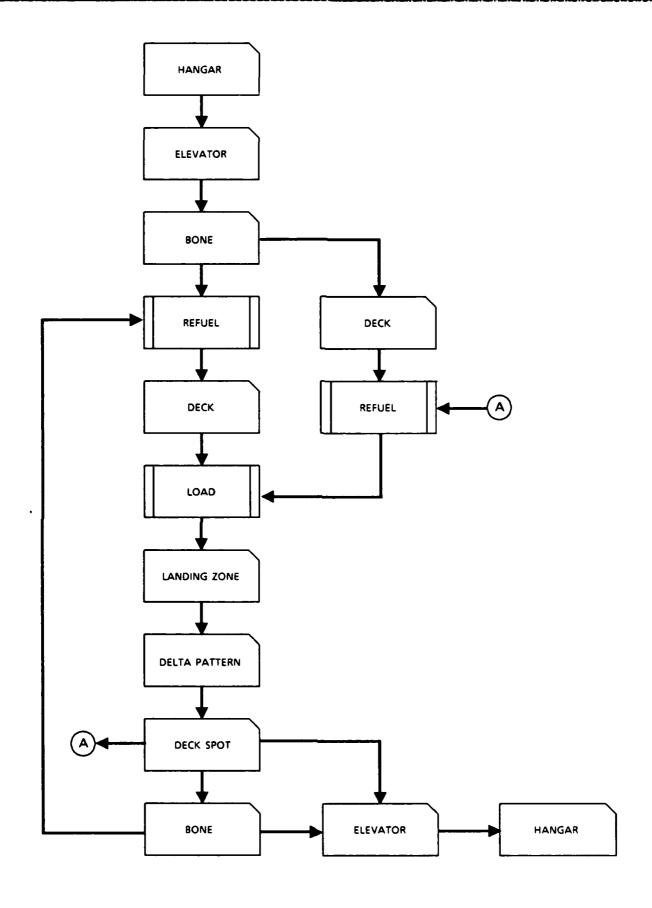

FIGURE 3. HELICOPTER FLOW THROUGH SYSTEM

Chapter 3

MODEL DESCRIPTION

The model was coded in Simscript II.5 and run on a VAX 11/785. A model listing appears in appendix A. This chapter describes how the model works with a section that details the model events, a section that defines the model entities and their attributes, and a section that presents potential measures of effectiveness that are currently in the model.

3.1 EVENT DESCRIPTIONS

In this section, the model events are described. Each subsection addresses one event with a text description followed by a flowchart. The order in which the events appear is alphabetical.

Several comments concerning conventions and symbols in the flowcharts may be helpful to the reader. There is a distinction between AC and A/C; AC refers to the aircraft that has been passed to the event, whereas A/C refers to all other aircraft that are treated during the event process. The triangular node indicates the beginning of an event. The rectangular node represents a positive action that occurs at that point in the model, whereas the rectangular node with extra vertical lines represents a comment concerning a state or a set of actions. There are two symbols that transfer the flow to different areas of the event, signified by a node with a single letter. The first symbol is a circle, and in this case, the flow is transferred to another area on the same page. The other symbol has five sides, and transfers the flow to another page of this event. The return node indicates a state in the simulation where control is returned to the Simscript scheduler, and marks the end of activity in the current event.

3.1.1 EVENT AC.LAUNCHED GIVEN AC

The occurrence of this event signals the departure of AC from the ship. The event DELTA.ARRIVAL is scheduled by computing the time required to make the round trip to the landing zone and adding the time (random) necessary to accomplish its mission (time to unload). A deck spot becomes available, and a SPOT.OPEN event is scheduled.

EVENT AC.LAUNCHED GIVEN AC

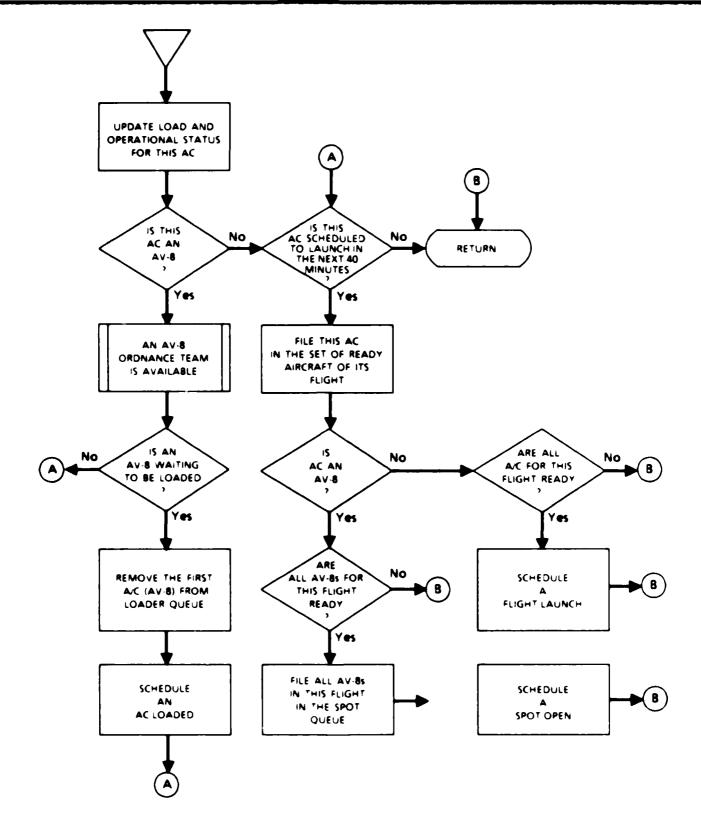

and and a factor in the last of the last o

3.1.2 EVENT AC.LOADED GIVEN AC

The occurrence of this event signals the completion of the loading process for the aircraft AC. The action that occurs next depends on the type of aircraft that AC is and its launch time.

If AC is an AV-8, an ordnance team becomes available, and if another AV-8 is waiting for an ordnance team, — AC.LOADED is scheduled. If AC has a launch time in the next 40 minutes, and both AV-8s in this flight have now been loaded, they are ready to be respotted to the takeoff line prior to launch. This is accomplished by filing them in the spot queue and scheduling a SPOT.OPEN event.

If AC is a helicopter, has a launch time in the next 40 minutes, and all aircraft of this flight have been loaded (launch time should be less than 10 minutes away if all aircraft are loaded), then a FLIGHT.LAUNCH event is scheduled.

EVENT AC.LOADED GIVEN AC

3.1.3 EVENT AC.RECOVERED GIVEN AC

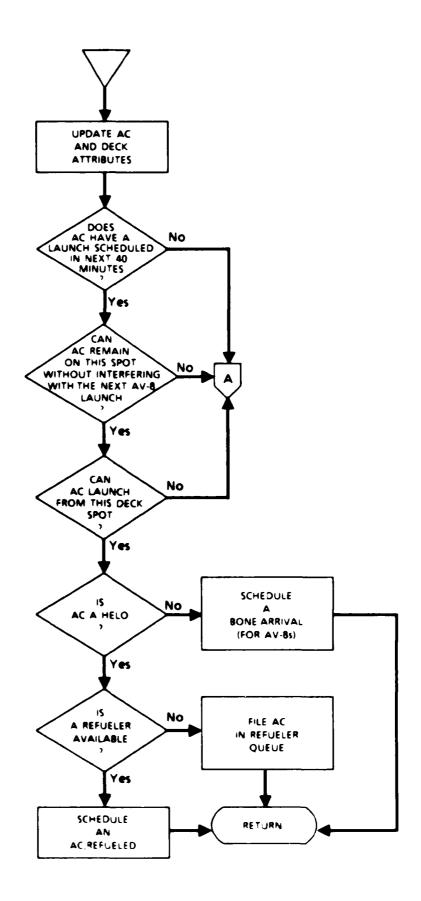

This event occurs when the aircraft AC has returned to the ship and landed on one of the six deck spots. AC will remain on this deck spot only if all of the following conditions are satisfied:

- : AC must have a launch time scheduled to occur in the next 40 minutes
- : AC's presence on this deck spot must not interfere with the next AV-8 launch
 - : AC must be compatible to launch from this deck spot
 - : AC must be a helicopter

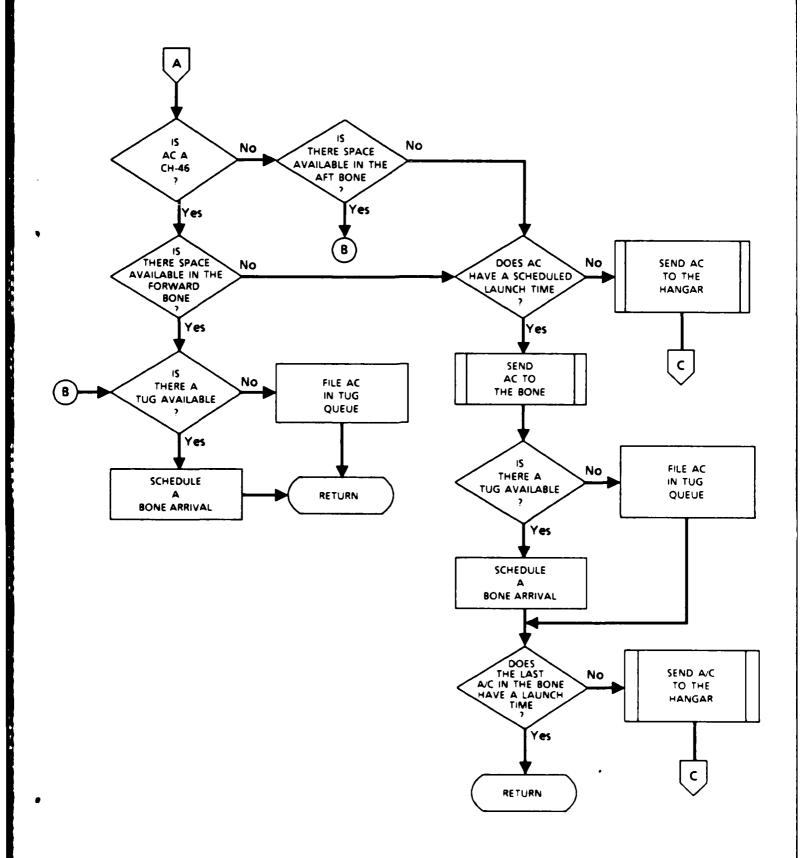

If all of these conditions are satisfied, the next step for this helicopter is to schedule an AC.REFUELED event.

If any of these conditions are not met, AC is sent to the appropriate bone if there is space in that bone. If the bone is full, AC is still sent to the bone if AC has a scheduled launch time; otherwise, AC is sent to the hangar. Helicopters require a tug in all cases for deck movement. AV-8s can respot to the bone under their own power, but require a tug when going to the hangar (elevator).

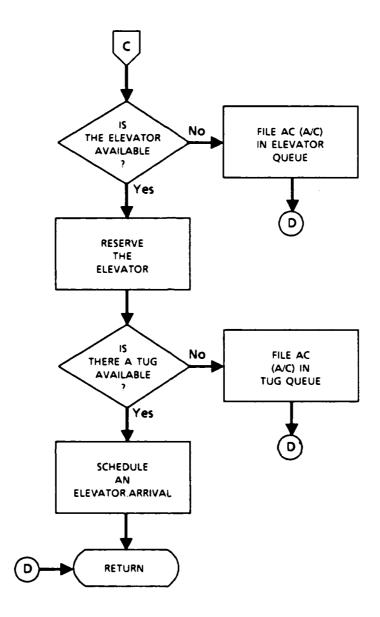

If the bone was full and AC has scheduled a BONE.ARRIVAL, the aircraft in that bone are checked for any that do not have a future launch time. If one is found, this aircraft is sent to the hangar (elevator).

EVENT AC.RECOVERED GIVEN AC

CONTINUED: EVENT AC.RECOVERED

CONTINUED: EVENT AC.RECOVERED

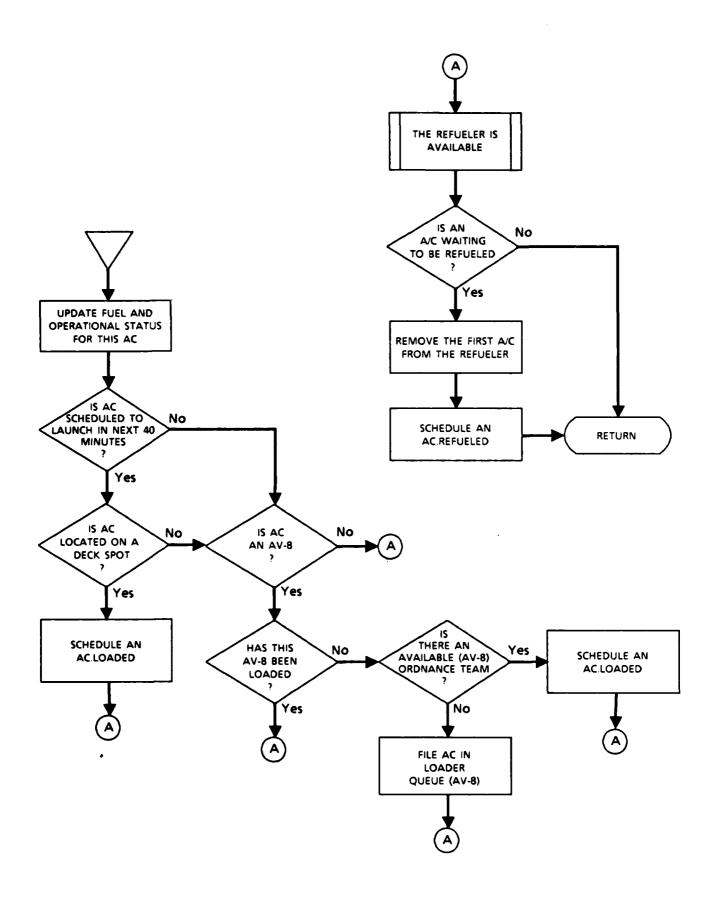

3.1.4 EVENT AC.REFUELED GIVEN AC

The occurrence of this event signals the completion of the refueling process for the aircraft AC. The action that occurs next depends on the type of aircraft that AC is and the launch time of AC.

If AC is an AV-8 and the loading of ordnance has not started, regardless of the next launch time for AC, the next step is to schedule an AC.LOADED event. Although not currently played in the model, these aircraft without launch times can be thought of as aircraft that are being readied for on-call missions.

If AC has a launch time in the next 40 minutes and is located on a deck spot, then it must be a helicopter, because AV-8s are not refueled on deck spots. The next step for this helicopter is to schedule an AC.LOADED event. The loading event will be scheduled to occur no more than 10 minutes prior to the scheduled launch time.

In all cases, a refueler becomes available when an AC.REFUELED event occurs. If an aircraft is waiting to be refueled, it is removed from the refueler queue and an event AC.REFUELED is scheduled.

EVENT AC.REFUELED GIVEN AC

MOTOR STATEMENT OF THE STATE OF

3.1.5 EVENT AC.RESPOTTED GIVEN AC

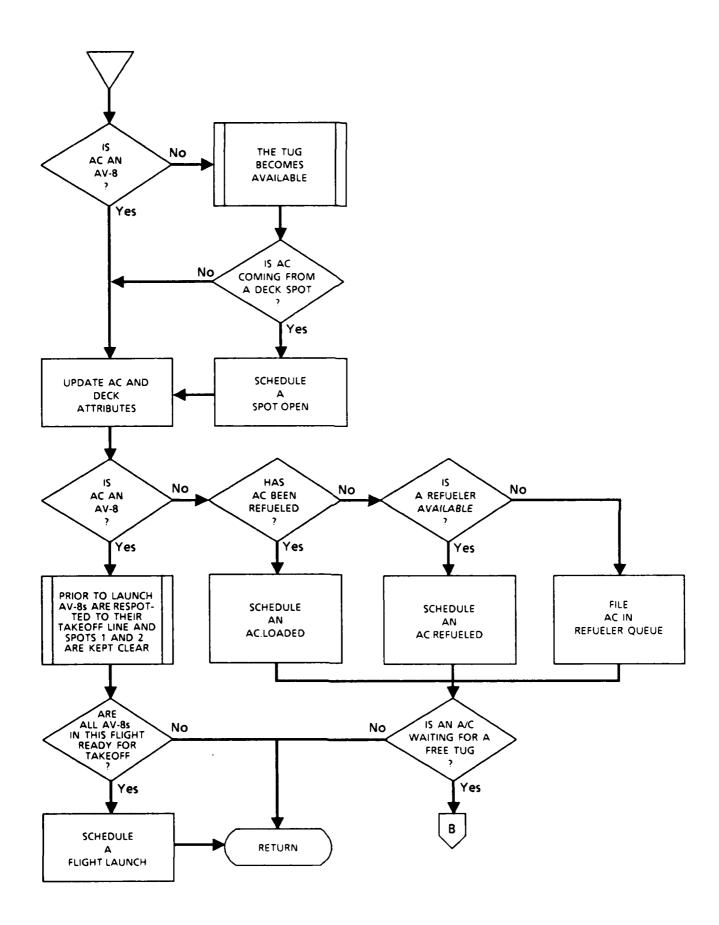

The occurrence of this event signals that AC has arrived at one of the six deck spots from which an aircraft may launch.

If AC is an AV-8, the movement has been made under its own power to the short takeoff line without a tug. The respotted AV-8 has been fueled and loaded, and is ready for takeoff. If both AV-8s in this flight are ready to launch, a FLIGHT.LAUNCH event is scheduled.

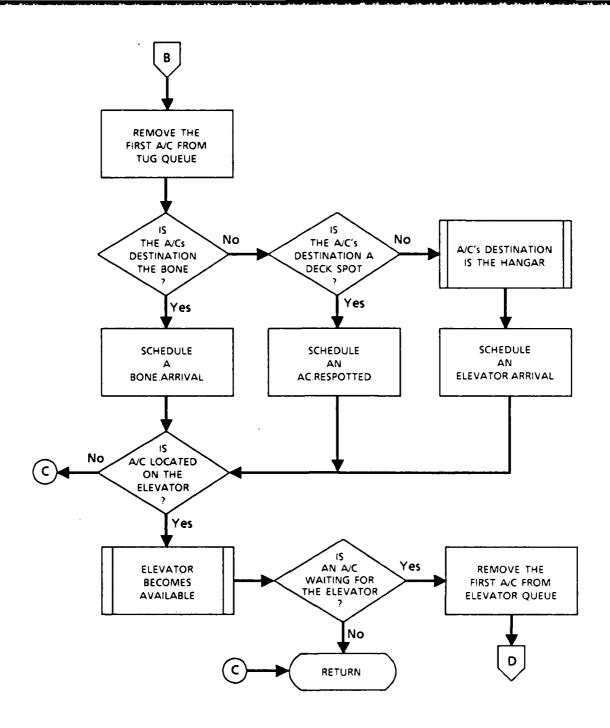

If AC is a helicopter, the movement has been made with a tug, and this tug becomes available to move another aircraft. If the helicopter has not been refueled, then the next event for this helicopter is an AC.REFUELED. If the helicopter has been refueled, the the next event scheduled will be an AC.LOADED. The loading event will be scheduled to occur no more that 10 minutes prior to the helicopter's scheduled launch time.

If there are aircraft waiting for a tug, and a tug is now free, the first aircraft in tug queue is removed from the queue and the appropriate event is scheduled to move it to its destination. If this aircraft was located on the elevator, the elevator becomes available.

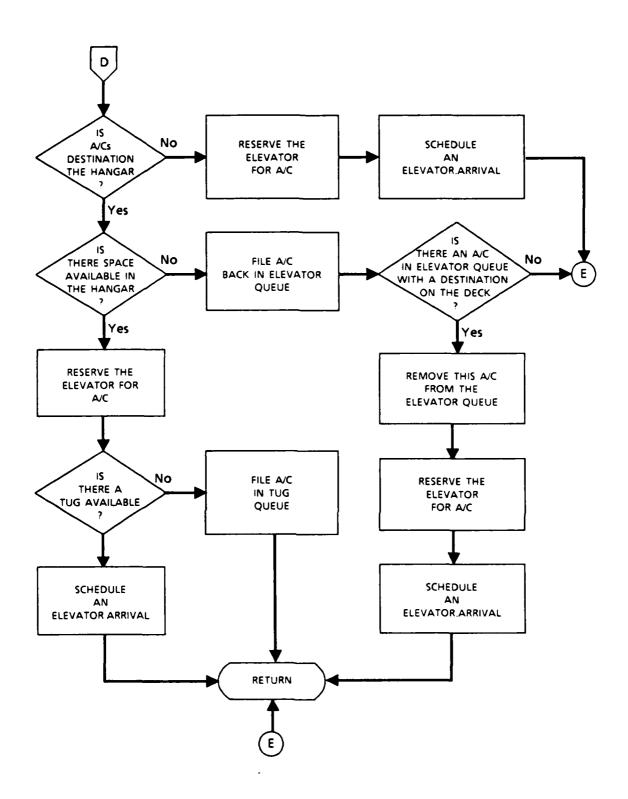

If the elevator is available and there are aircraft waiting in the elevator queue, the first aircraft in the queue whose destination is able to receive it is removed from queue, and an ELEVATOR.ARRIVAL event is scheduled.

EVENT AC.RESPOTTED GIVEN AC

CONTINUED: EVENT AC.RESPOTTED

CONTINUED: EVENT AC.RESPOTTED

3.1.6 EVENT BONE.ARRIVAL GIVEN AC

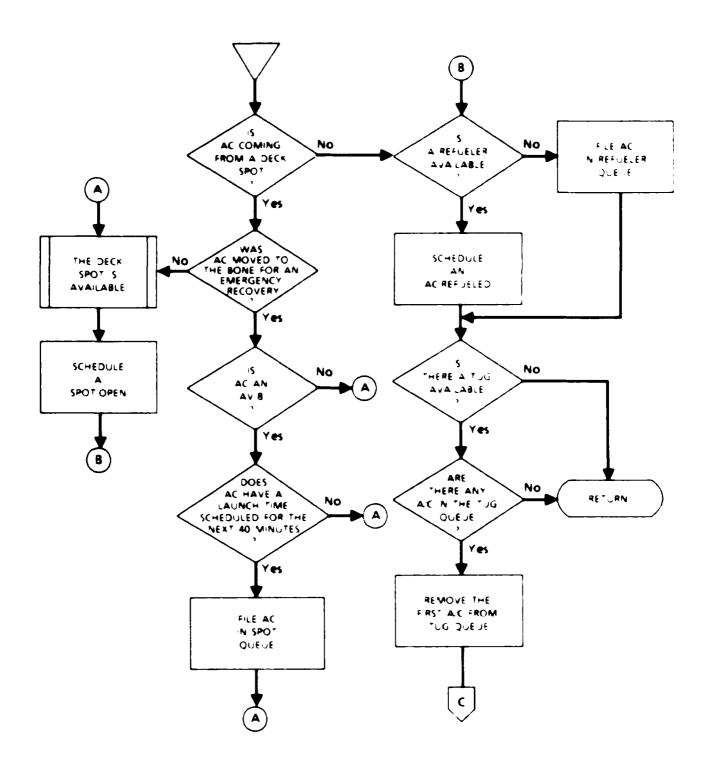

The occurrence of this event signals that AC has respotted to either the forward or aft bone.

If ACs last location was a deck spot, the spot is now available and a SPOT.OPEN event is scheduled.

If AC requires fuel and a refueler is available, an event AC.REFUELED is scheduled. Otherwise, AC is filed in the queue to await the next available refueler.

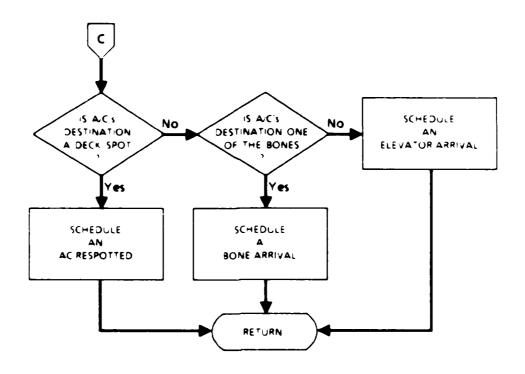

If there are aircraft waiting for a tug, and a tug is now free, the first aircraft in tug queue is removed from the queue and the appropriate event is scheduled to move it to its destination. If this aircraft was located on the elevator, the elevator becomes available.

If the elevator is available and there are aircraft waiting in the elevator queue, the first aircraft in the queue whose destination is able to receive it is removed from queue, and an ELEVATOR.ARRIVAL event is scheduled.

EVENT BONE.ARRIVAL GIVEN AC

managa kanaga kanag

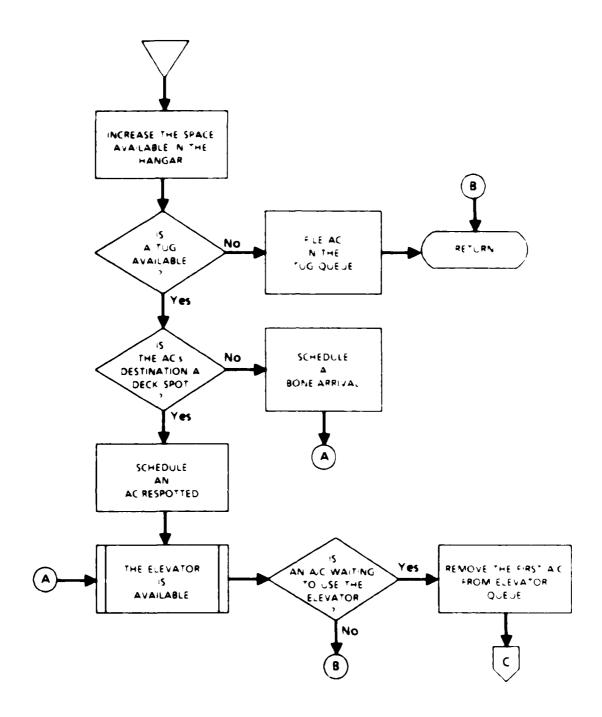

CONTINUED: EVENT BONE.ARRIVAL

3.1.7 EVENT DECK.ARRIVAL GIVEN AC

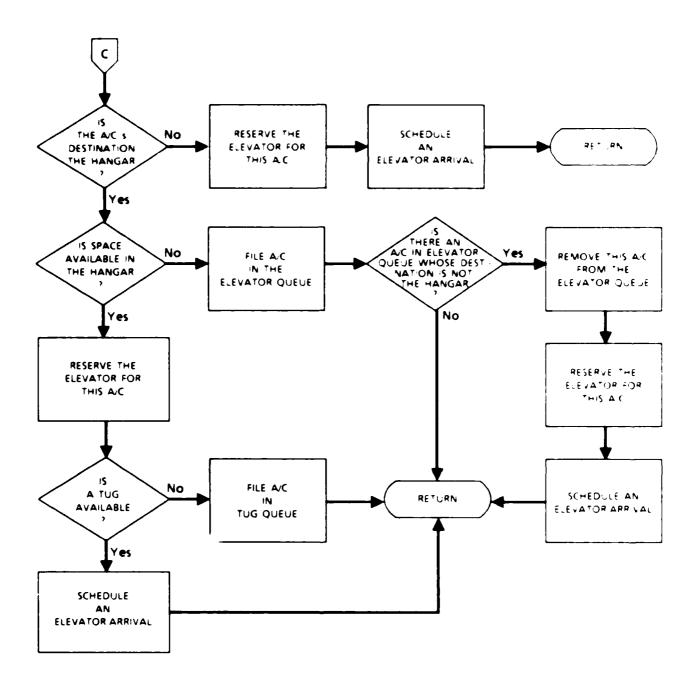

This event occurs when AC has arrived by elevator to the flight deck. In all cases, a tug is required to move AC to and from the elevator. If a tug is available, the event BONE.ARRIVAL or AC.RESPOTTED is scheduled depending on the destination of AC. Also, if a tug is available, the elevator will soon be available, and the elevator queue is checked for waiting aircraft.

If an aircraft is waiting for the elevator, and its destination is the hangar, there must be space available in the hangar. If these conditions are met, the elevator is reserved. If a tug is available, an ELEVATOR.ARRIVAL event is scheduled.

If an aircraft is waiting for the elevator, and its destination is the flight deck, the elevator is reserved and an ELEVATOR.ARRIVAL event is scheduled. (The tug on the hangar deck is assumed to be available whenever the elevator is.)

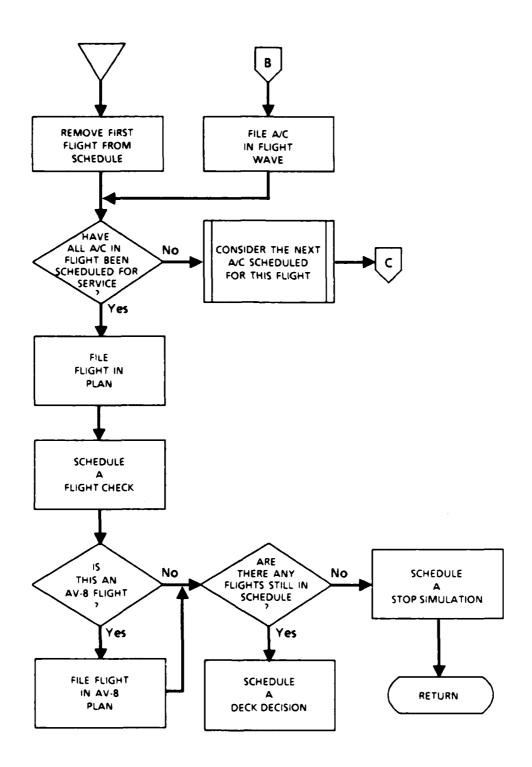

EVENT DECK.ARRIVAL GIVEN AC

CONTINUED: EVENT DECK.ARRIVAL

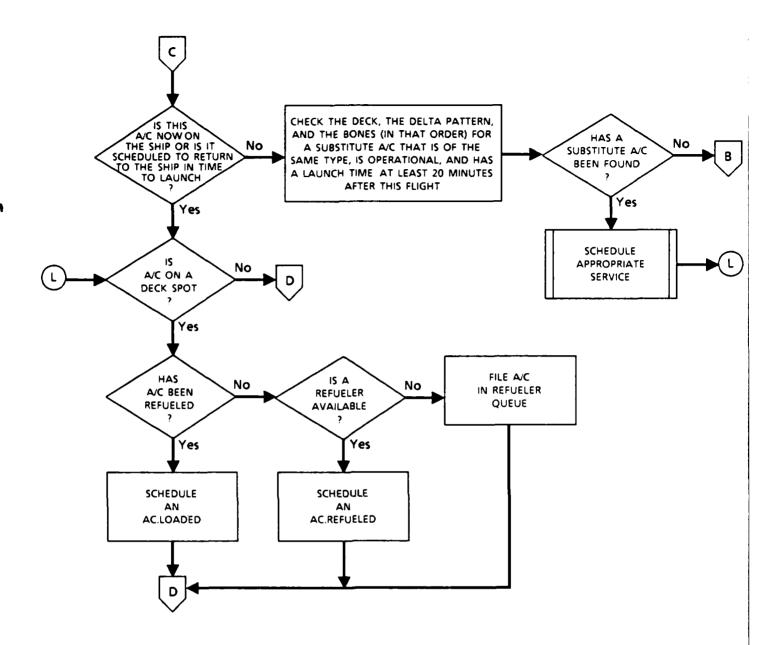

3.1.8 EVENT DECK.DECISION GIVEN FLIGHT

The primary function of this event is to ensure that aircraft with approaching launch times are preparing to launch. If an aircraft is not likely to be ready, it is replaced with another aircraft if one is available. The checking of aircraft statuses takes place 40 minutes prior to the scheduled launch time. If an aircraft has not begun making the necessary preparations, the appropriate event(s) are scheduled.

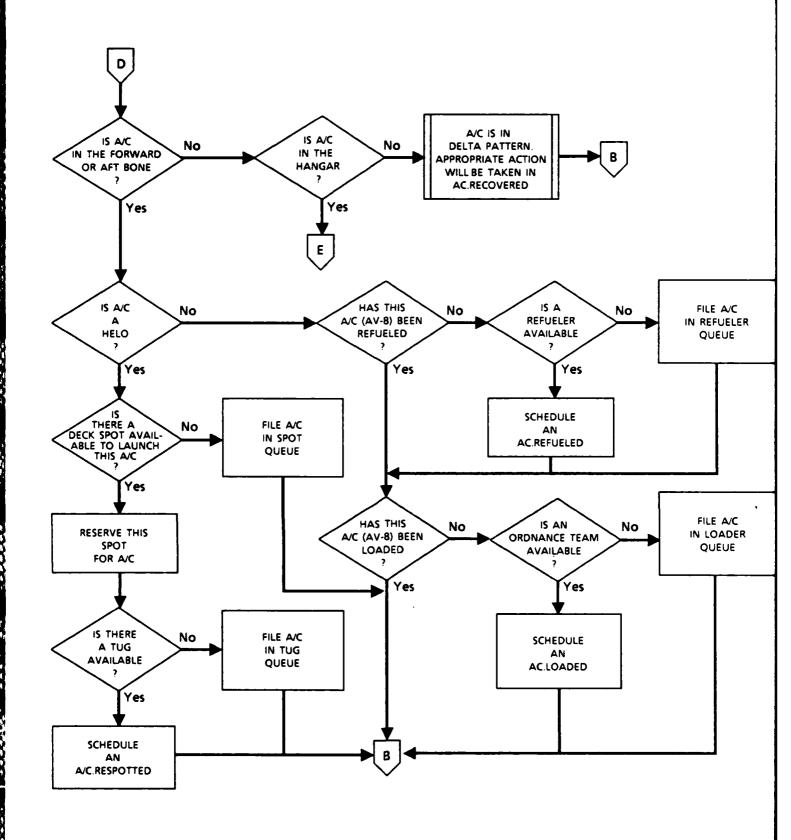

EVENT DECK.DECISION GIVEN FLIGHT

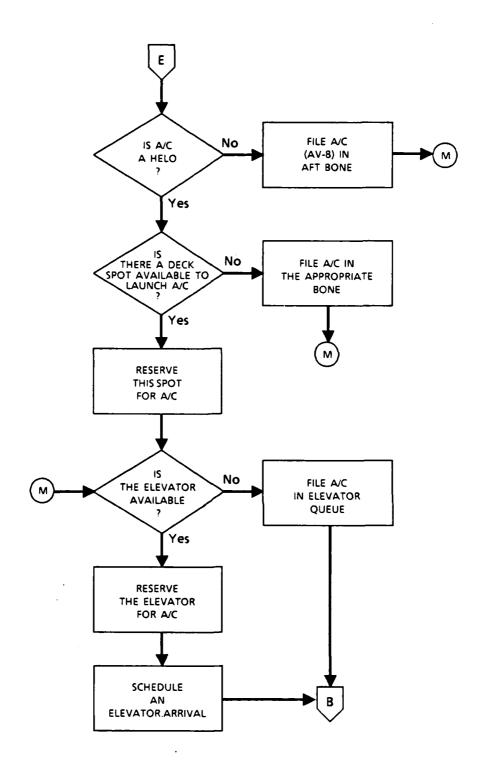

መመከተዋቸው የመመከተቸው መመጀመር እና ተመጀመር የተለጉ ተስፈርተ የተለከተ የተ

CONTINUED: EVENT DECK.DECISION

CONTINUED: EVENT DECK.DECISION

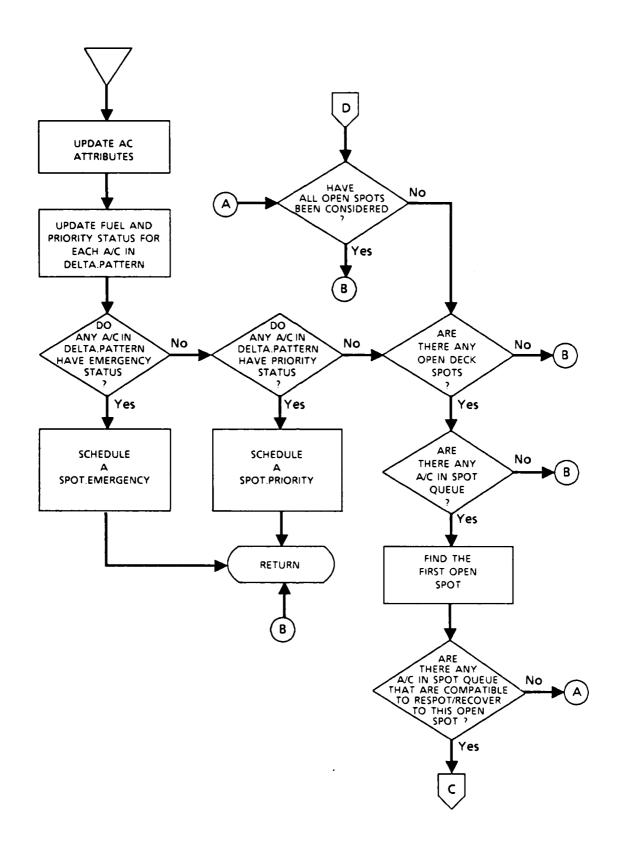

CONTINUED: EVENT DECK.DECISION

3.1.9 EVENT DELTA.ARRIVAL GIVEN AC

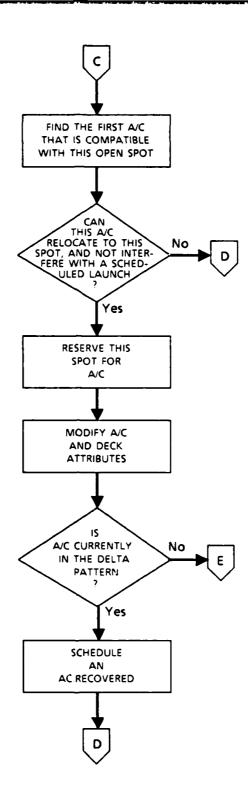

This event occurs when AC has completed its mission and returned to the ship's vicinity for recovery. AC enters the holding (delta) pattern to await clearance to land. The fuel status of each aircraft in the delta pattern is updated and checked to see if it entitles the aircraft for priority or emergency treatment.

If an aircraft is qualified for special treatment, either event SPOT EMERGENCY or SPOT.PRIORITY, as appropriate, is scheduled.

If no aircraft qualifies for special treatment, aircraft in the spot queue are considered for recovery or respotting to any open spots. Any aircraft that are compatible with an open spot, and will not interfere with another aircraft's launch are scheduled for an AC.RECOVERED or AC.RESPOTTED event.

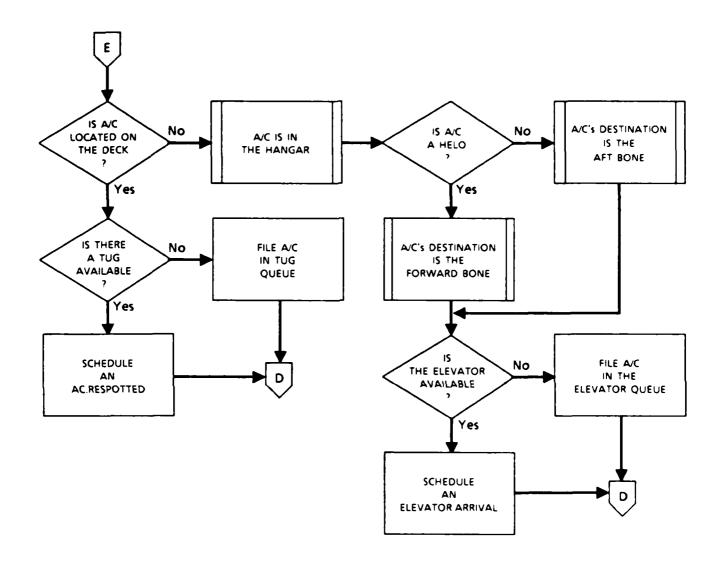

EVENT DELTA, ARRIVAL GIVEN AC

(CONTINUED)
EVENT DELTA.ARRIVAL GIVEN AC

33.7.2.2.2

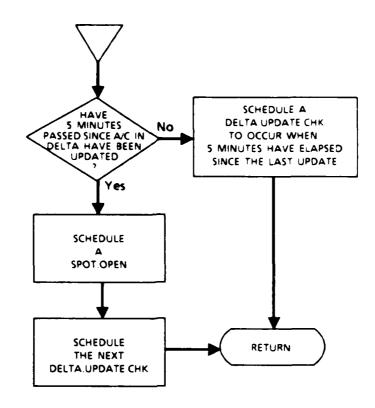

(CONTINUED) EVENT DELTA.ARRIVAL

3.1.10 EVENT DELTA.UPDATE.CHK

This event occurs at least once every five minutes. Its purpose is to ensure that the fuel levels of aircraft in the delta pattern are remaining at safe levels. It accomplishes this by ensuring that the delta update algorithm in the DELTA.ARRIVAL and SPOT.OPEN events is activated at least once every five minutes.

If five minutes have passed since the last update, a SPOT.OPEN event is scheduled.

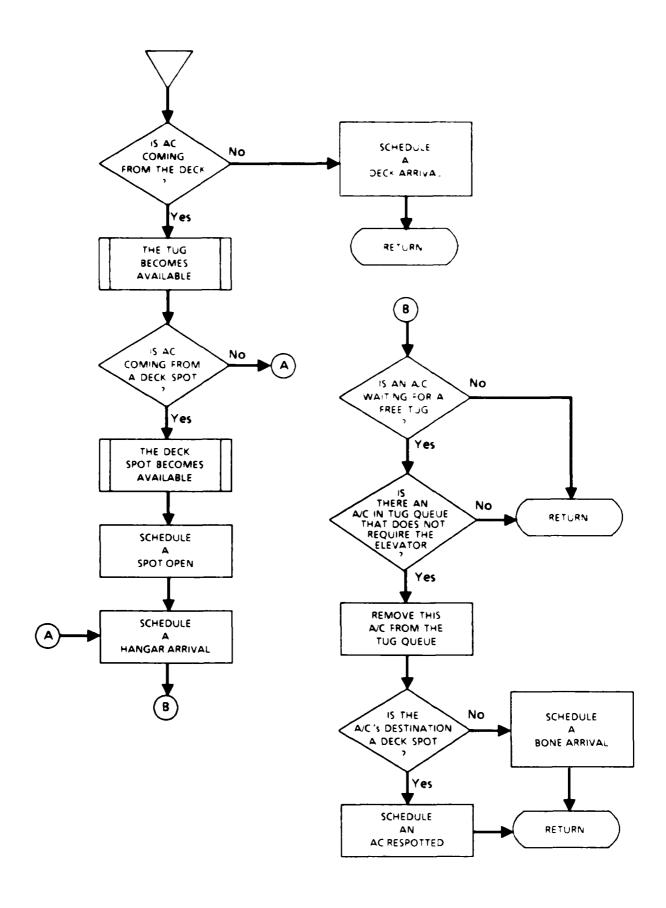

EVENT DELTA.UPDATE.CHK

3.1.11 EVENT ELEVATOR.ARRIVAL GIVEN AC

This event occurs when the aircraft AC has been respotted to the elevator and tied down before the movement between the hangar and flight decks.

If AC is going to the hangar deck, a tug becomes available, and a HANGAR.ARRIVAL event is scheduled. If AC is coming from a deck spot, the deck spot becomes available and a SPOT.OPEN event is scheduled.

If AC is going to the flight deck, a DECK.ARRIVAL event is scheduled. If there are aircraft waiting for a tug, and a tug is now free, the first aircraft in tug queue is removed from the queue and the appropriate event is scheduled to move it to its destination.

EVENT ELEVATOR.ARRIVAL GIVEN AC

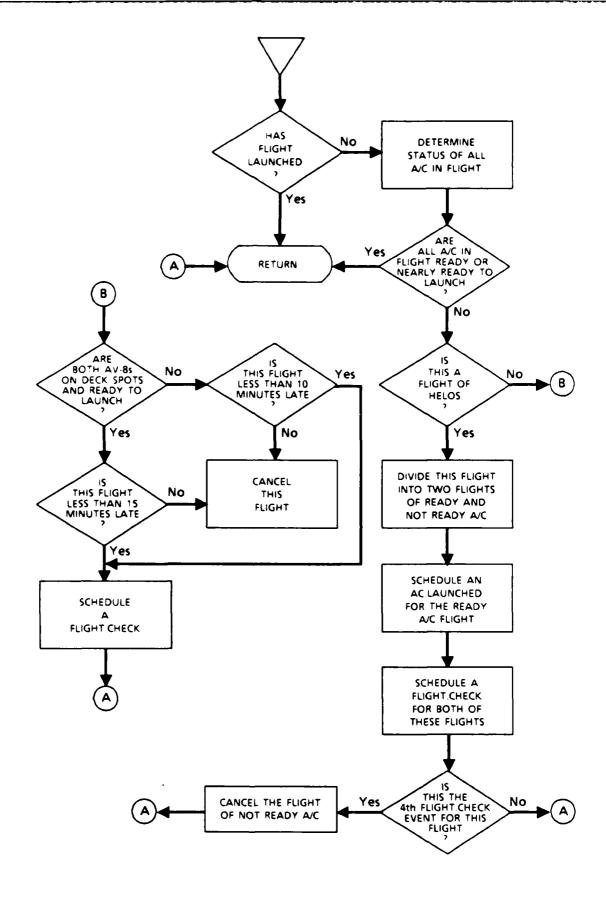

3.1.12 EVENT FLIGHT.CHECK GIVEN FLIGHT

The function of this event is to check whether or not a flight has launched, and if it has not, determine whether or not it should be cancelled. This event is scheduled in event DECK.DECISION, and occurs shortly after the scheduled launch time of FLIGHT.

If this is a flight of helicopters, the aircraft ready for takeoff will be launched at this point. If this is the fourth time that a FLIGHT.CHECK event has occurred for this FLIGHT, the aircraft that are not on deck in the final stages of preparation will have their launch times cancelled.

If this is a flight of AV-8s, both aircraft in the flight must be ready prior to launching the flight, because AV-8s always fly in groups of two. After a certain amount of time past the scheduled launch time, the flight will be cancelled.

If the flight has not been cancelled, another event FLIGHT.CHECK is scheduled.

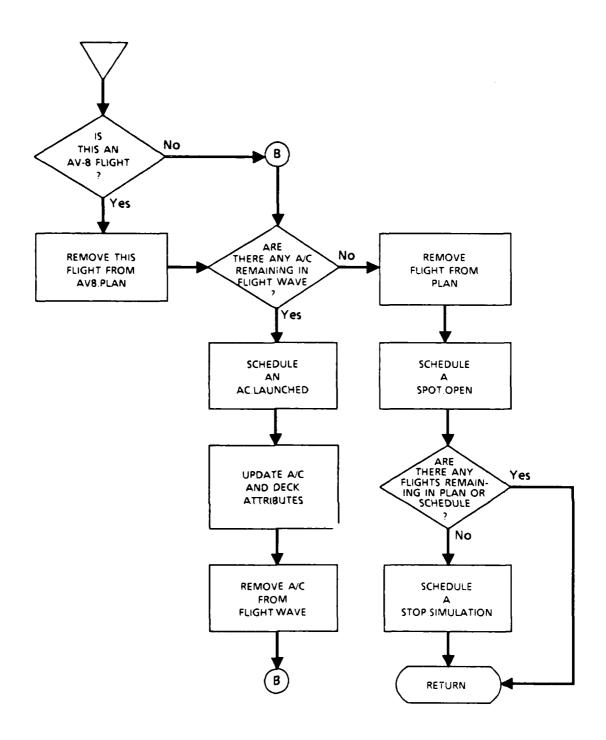

EVENT FLIGHT.CHECK GIVEN FLIGHT

3.1.13 EVENT FLIGHT.LAUNCH GIVEN FLIGHT

This event occurs when all aircraft scheduled to launch in this flight have completed refueling and loading, and are ready on deck spots to launch. Each aircraft in the flight has an event AC.LAUNCHED scheduled, and an event SPOT.OPEN is scheduled to follow the launch of the last aircraft in this flight.

If this was the last flight in the PLAN or SCHEDULE, an event STOP.SIMULATION is scheduled.

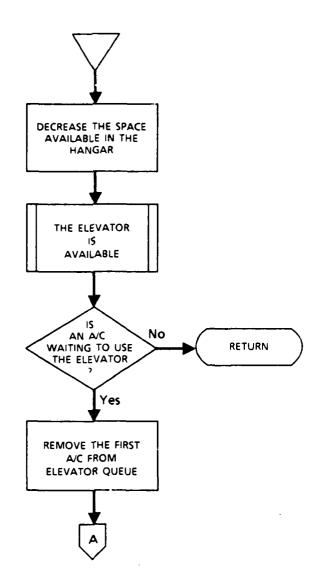

EVENT FLIGHT.LAUNCH GIVEN FLIGHT

3.1.14 EVENT HANGAR.ARRIVAL GIVEN AC

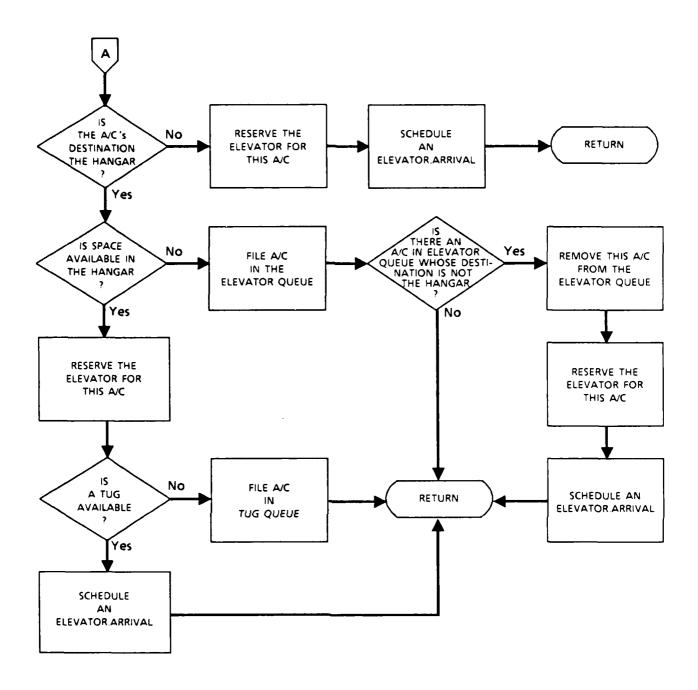

This event occurs when AC has arrived by elevator to the hangar deck. The hangar deck's tug is always available to remove aircraft from the elevator, so the elevator will soon become available, and the elevator queue is checked for waiting aircraft.

If an aircraft is waiting for the elevator, and its destination is the hangar, the hangar is checked to determine if there is space available. If these conditions are met, the elevator is reserved. If a tug is available, an ELEVATOR.ARRIVAL event is scheduled.

If an aircraft is waiting for the elevator, and its destination is the flight deck, the elevator is reserved and an ELEVATOR.ARRIVAL event is scheduled. (The tug on the hangar deck is assumed to be available whenever the elevator is.)

EVENT HANGAR.ARRIVAL GIVEN AC

ELECTRONIC SECURISE SECURISE

SAVARA INSPERIO INSPERIO INSPERIO

CONTINUED: EVENT HANGAR.ARRIVAL

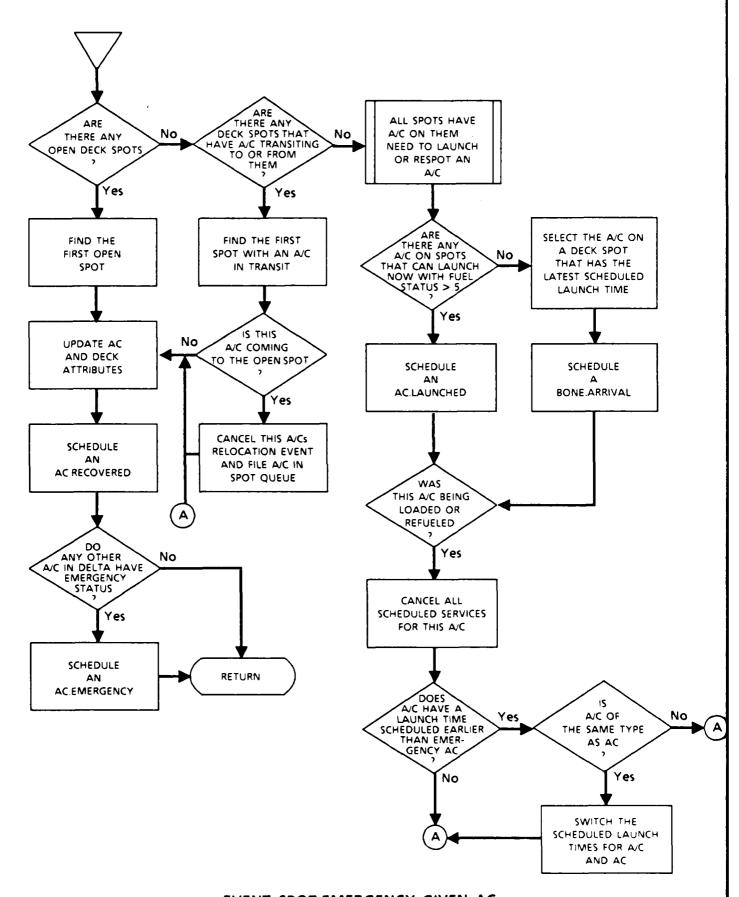

3.1.15 EVENT SPOT.EMERGENCY GIVEN AC

This event occurs when aircraft AC has entered a fuel emergency situation while waiting in the delta pattern to be assigned a deck spot for recovery to the ship.

If there are any deck spots open, the first open spot is reserved for AC and an AC.RECOVERED event is scheduled.

If there are no open spots, but there is a deck spot with an aircraft transiting to or from it, then this spot is reserved for AC, and an AC.RECOVERED event is scheduled. If the aircraft in transit was not leaving the spot, the relocation event for this aircraft is cancelled and the aircraft is filed in the spot queue to be considered for another spot.

If there are no open spots and no aircraft in transit to or from a spot, it is necessary to displace an aircraft to recover AC. The fuel status and launch time of each aircraft currently on a deck spot is checked to find an aircraft that has at least half a tank of fuel and is capable of launching immediately. If an aircraft is found meeting these requirements, an AC.LAUNCHED event is scheduled to clear a spot for AC to recover. If an aircraft cannot be found to launch, the aircraft on a deck spot with the latest launch time will schedule a BONE.ARRIVAL event. If the displaced aircraft was being refueled or loaded, the scheduled completion of these events is cancelled. If the emergency aircraft and the displaced aircraft are of the same type, and the displaced aircraft has an earlier scheduled launch time, these aircraft exchange launch times to minimize the potential for launch delay caused by the emergency recovery.

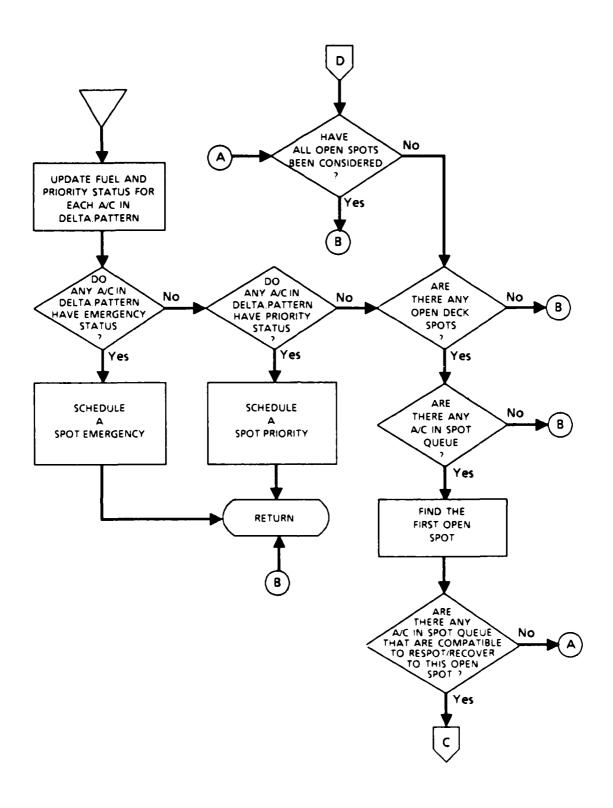

EVENT SPOT.EMERGENCY GIVEN AC

3.1.16 EVENT SPOT OPEN

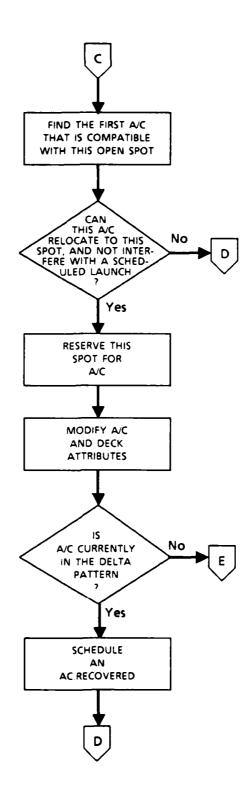

This event occurs at regular intervals (see event DELTA.UPDATE.CHK), and whenever a deck spot has been vacated by another aircraft. The fuel status of each aircraft in the delta pattern is updated and checked to see if it entitles the aircraft for priority or emergency treatment.

If an aircraft is qualified for special treatment, either event SPOT.EMERGENCY or SPOT.PRIORITY, as appropriate, is scheduled.

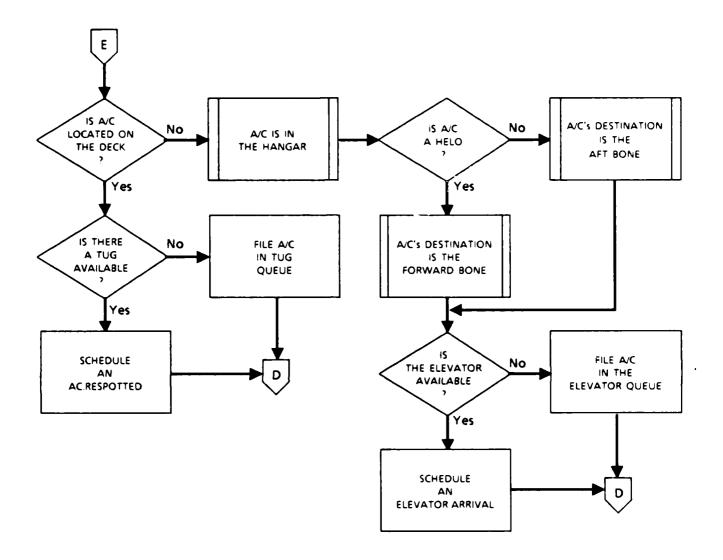

If no aircraft qualifies for special treatment, aircraft in the spot queue are considered for recovery or respotting to any open spots. Any aircraft that are compatible with an open spot, and will not interfere with another aircraft's launch are scheduled for an AC.RECOVERED or AC.RESPOTTED event.

EVENT SPOT.OPEN

(CONTINUED) EVENT SPOT.OPEN

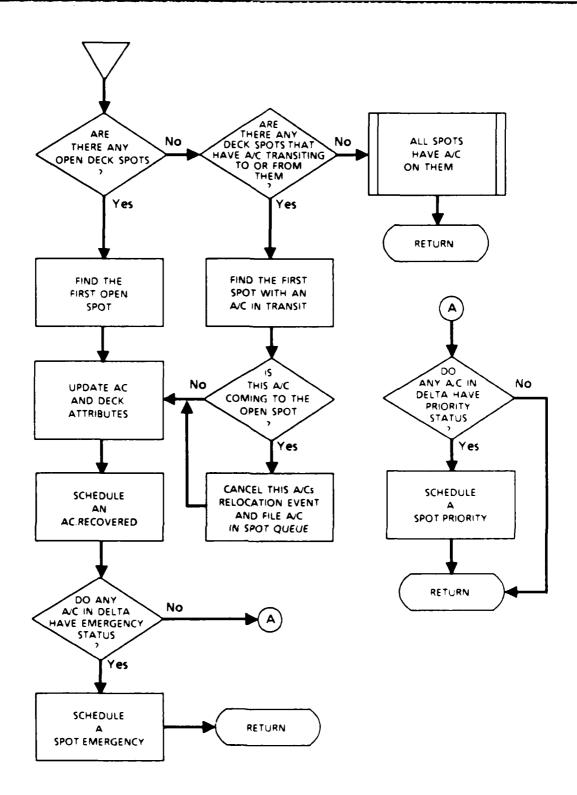

(CONTINUED) EVENT SPOT.OPEN

3.1.17 EVENT SPOT.PRIORITY GIVEN AC

This event occurs when aircraft AC has entered a fuel priority situation while waiting in the delta pattern to be assigned a deck spot for recovery to the ship.

If there are any deck spots open, the first open spot is reserved for AC and an AC.RECOVERED event is scheduled.

If there are no open spots, but there is a deck spot with an aircraft transiting to or from it, then this spot is reserved for AC, and an AC.RECOVERED event is scheduled. If the aircraft in transit was not leaving the spot, the relocation event for this aircraft is cancelled and the aircraft is filed in the spot queue to be considered for another spot.

EVENT SPOT.PRIORITY GIVEN AC

3.2 DESCRIPTION OF ENTITIES AND THEIR ATTRIBUTES

The model utilizes two entity structures: the permanent entity ACE and the temporary entity FLIGHTE. A copy of ACE is created for each aircraft that participates in the simulation. The attributes of ACE are defined as follows:

:AC.DELTA.ARRIVAL.TIME - The time at which ACE arrived to the delta pattern

:AC.DESTINATION - The next location planned for ACE

:AC.FLYING.TIME - The amount of time that ACE can/could remain airborne with the fuel it currently has on board

:AC.FUEL.STAT - The percent of a full fuel tank that ACE has on board

:AC.ID - An identification number assigned to ACE

:AC.LAUNCH.TIME - ACE's next scheduled launch time

:AC.LOAD.STAT - The percent of a full load that ACE has on board

:AC.LOCATION - The present location of ACE

:AC.OP.STAT - The operational status of ACE

:AC.PRIORITY - The priority assigned to ACE for recovery when in the delta pattern

:AC.RECOVERY.TIME - The time at which ACE was recovered to the flight deck

:AC.SERVICE.FLAG - Equals 1 if ACE is being loaded or refueled, 0 otherwise

:AC.TAKEOFF.TIME - The time at which ACE launched from the ship :AC.TYPE - Equals 1 if ACE is a CH-46, 2 if a CH-53, and 3 if an AV-8

A FLIGHTE entity is created for each flight that is to be scheduled during the simulation. The attributes of FLIGHTE are defined as follows:

:FLT.AC.NUM - The number of aircraft assigned to FLIGHTE

:FLT.AC.RDY - The number of aircraft assigned to FLIGHTE that are ready to launch

:FLT.AC.TYPE - The type of aircraft in this flight; corresponds with AC.TYPE

:FLT.DELAY - The amount of time that FLIGHTE is late for takeoff :FLT.NUM - An identification number assigned to FLIGHTE

:FLT.TIME - The time that FLIGHTE is scheduled to launch :FLT.WAVE - The set that contains the aircraft assigned to FLIGHTE

3.3 MEASURES OF EFFECTIVENESS

The model currently has a number of bookkeeping routines built in that generate a number of potential measures of effectiveness. Tables 1-3 list portions of the summary file that displays this output for a sample run.

The first table compares the planned flight schedule with the actual launches as they occurred. This information allows the user to investigate delays and cancelled missions by aircraft and flight. The second table displays in chronological order the times at which launches occurred by aircraft type. This information can be used to create histograms and compare launch rates. The third table lists a number of measures that track utilization, average queue size, and completion times for a number of service related activities and structures.

TABLE 1

Chapter 4

ANALYSIS OF THE AV-8/HELO MIX PROBLEM

The inputs that were used to run the model for this problem are listed in table 4. The distribution inputs are based on exercise results, however, all have been modified to account for expedients that would be taken during the conduct of an actual assault. These modifications ruled out using distributions which fit the exercise data, but provided approximations for the minimum, maximum, mean, and mode. In several cases, a shifted Beta distribution was chosen, and the parameters were determined by these approximations. Table 5 presents the distributions with associated parameters used for the event scheduling in model runs, and the random number stream assignments. In the absence of actual assault data, goodness-of-fit tests were not conducted.

The simulation begins with the aircraft at locations and statuses as shown in table 6. Helicopters of the second wave are in the delta pattern with full fuel tanks to minimize the interval between the first and second wave; it takes less time to recover-load-launch than it does to respot-start-load-launch. The first flight of AV-8s launches after the second wave. Thereafter, an AV-8 flight follows every wave if an AV-8 flight is available. The schedule of launches for each case is shown in table 7.

The primary MOE for this problem is the force buildup rate ashore for each of the aircraft mixes. The model tracks the buildup rate by recording the time that each aircraft launches; this removes from consideration any

m case}$.

factors that might affect the transit from ship to shore that are not resident in the flight deck operations. In other words, the best case is the case that is able to launch the most aircraft in the shortest time. Three other MOEs that are related to buildup are the average launch delay, the number of cancelled launches, and the number of AV-8 launches. Table 8 presents summary statistics for each case after ten replicates.

In order to introduce positive correlation between the cases, the method of common random numbers was employed as a variance reduction technique. The ten replicates for the twelve AV-8 case were run and the initial seeds for each random number stream were saved for each replicate. The ten replicates were then run for the other cases using the same initial seeds for each replicate.

The addition of two AV-8s from six to eight provides potentially eight more AV-8 sorties, with an average of 7.8 more sorties realized. The penalty paid for this increase is a reduction in the amount of time the average launch precedes its scheduled time by approximately 80 seconds. As the average launch is still ahead of schedule, a subjective judgement is made that the gain in AV-8 sorties outweighs the loss in timeliness, and the discussion continues with the eight AV-8 case designated as more effective than the case with six AV-8s.

For the cases of ten and twelve AV-8s, adding additional AV-8s appears to actually reduce the expected number of AV-8 launches. The increase in the number of possible AV-8 launches is almost identical to the increase in the number of missions cancelled between the eight, ten, and twelve AV-8 cases. Table 9 shows the results of a closer look at the cases of eight and ten AV-8s using paired differences and paired-t confidence intervals

The results support the earlier observations, with 95 percent confidence, the expected number of additional missions cancelled lies in the interval (7.3.11.3), and the expected number of additional AV-8 sorties lies in the interval (-2.8.0.8). Also, the increase in launch delay is significant, and with 95 percent confidence the average launch will occur more that 5 minutes late for the 10 AV-8 case. Applying the Bonferroni inequality, the overall confidence that these three intervals simultaneously contain their respective true measures is at least 85 percent.

Figures 4-6 present graphical representations of the differences in buildup rate for the 6, 8, and 10 AV-8 cases. As can be seen, there is essentially no change in the buildup rate between the 6 and 8 AV-8 cases for helicopters, but there is a marked and consistent increase in the buildup rate for AV-8s. Between the 8 and 10 AV-8 cases, some decrease in the helicopter buildup

rate is seen, and while the AV-8 buildup rate for the 10 AV-8 case appears to be generally above that of the 8 AV-8 case, the frequent intersections of the two buildup lines imply that there is no real improvement offered by 10 AV-8s in the long run.

Given the inputs, initial conditions, and launch schedule presented in this section, the optimum number of AV-8s for simultaneous flight deck operations with a composite helicopter squadron during an assault from an LHA is eight. It should be noted again that the unavailability of AV-8s due to combat attrition and reliability failure has not been modelled. If these are relevant factors, then the MAU should deploy with additional AV-8s in order to sustain operations at the level of eight.
